SmartView

SmartView is a web-based, client server application. It's primary role is dedicated to the monitoring of Ampac's fire detection systems, from a single building installation employing one fire detection system to large multi-campus, multi-building facilities.

The system can also be tailored to monitor non-fire related events such as supervisory, security and process alarms. In addition, the extensive audit trail facilities allows for the comprehensive management of all event situations while command and control of remote systems can be undertaken seamlessly.

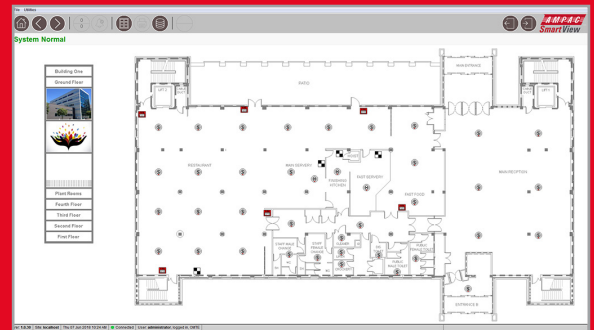

Despite its sophistication, SmartView remains simple to setup and configure. No two projects are the same which makes SmartView the ideal solution to today's innovative building designs and comprehensive site wide alarm systems.

Applications:

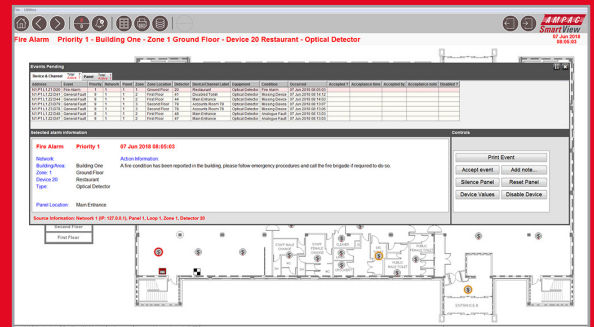

- Airports
- Shopping Centres
- Hospitals
- University Campus
- Industrial Sites
- Schools and Hotels
- City Wide Housing Authorities
- Power Generation
